

PORTFOLIO

Hi, I'm Denise, an aspiring front-end developer & remote support VA helping brands and startups build beautiful, functional websites and systems.

Let's build!

INTRODUCTION

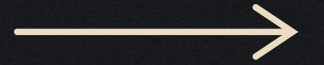

Hi, I'm Alezandra, a Computer Engineering graduate from the Technological Institute of the Philippines – Manila.

Over the years, I've gained hands-on experience in both engineering and virtual assistance, blending technical problem-solving with efficient remote support. While I've explored various areas, I naturally gravitate toward data science and frontend design, where I can merge logic, creativity, and real-world impact.

I'm passionate about building seamless digital experiences from designing user-friendly landing pages to organizing workflows in Notion and leveraging AI tools to boost productivity.

BEST PROJECTS

Alezandra Denise Reyes

BioMS

My Role:

- UI/UX designer and frontend developer for the monitoring dashboard
- Data handler for historical trend analysis and actionable insights
- Research and documentation writer for the final paper and presentation

We developed BioMS, an IoT-based system designed to help small-to-medium fish farmers monitor water quality in biofloc aquaculture — a sustainable fish farming method that recycles nutrients through microbial activity. The system collects real-time data from water sensors (e.g., temperature, pH, dissolved oxygen), sends alerts when values go out of range, and offers data-driven recommendations to help farmers maintain optimal conditions. It's designed to be affordable, user-friendly, and accessible to Filipino fish farmers with limited technical background.

WE CARE FOR YOUR EYE CARE

My Role:

- UI/UX designer and frontend developer for both web and mobile platforms
- Backend developer and SQL database designer
- Machine learning model trainer for personalized exercise recommendations
- Researcher and lead writer for documentation and final presentation

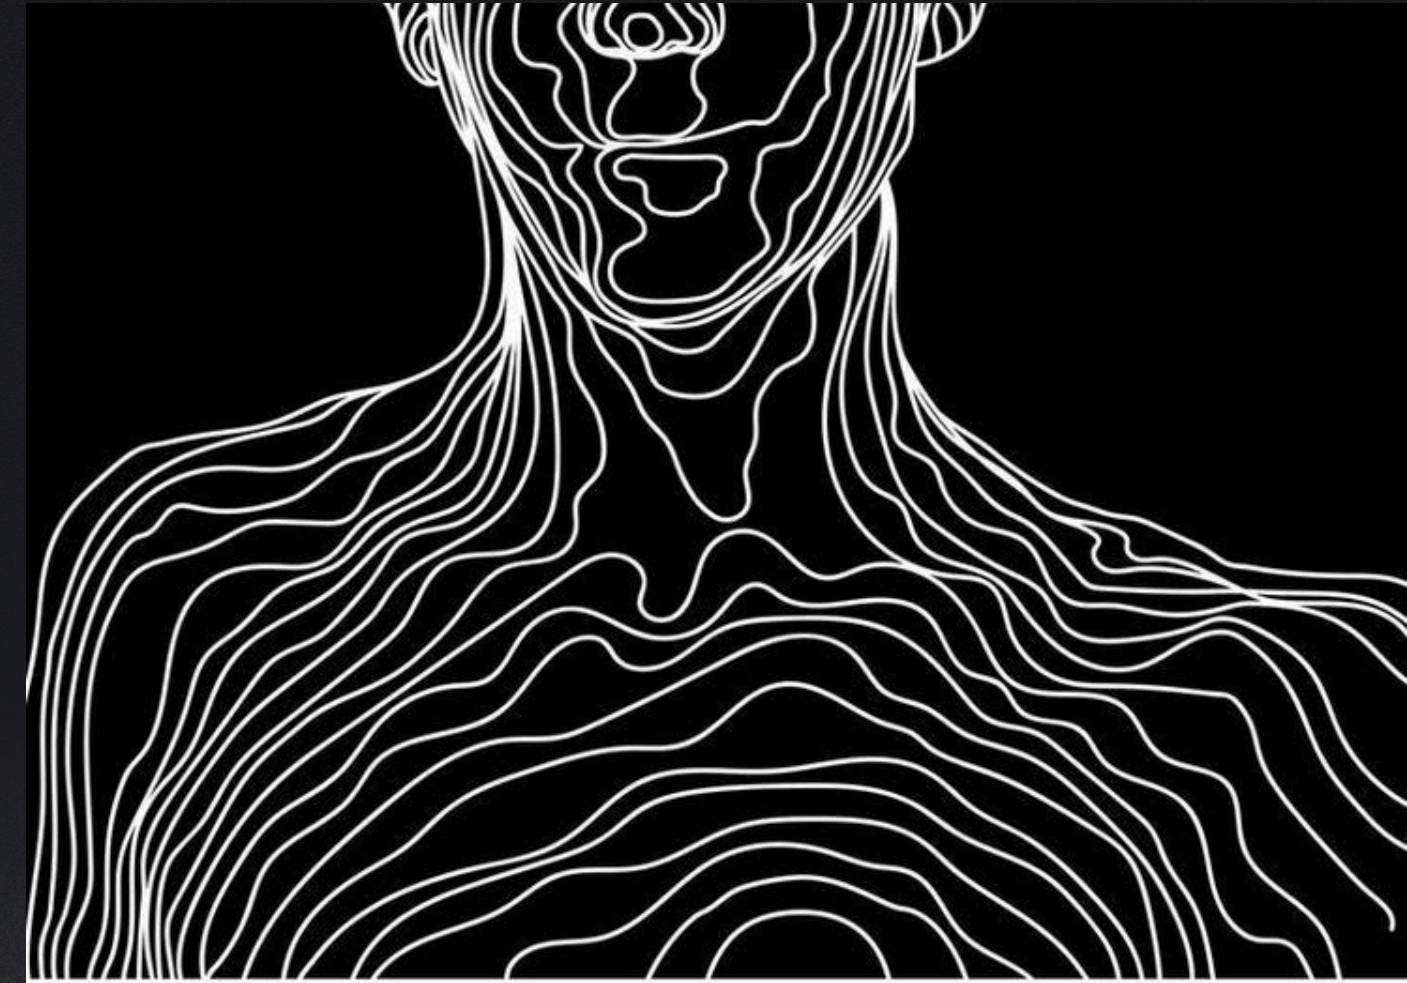

I developed We Care for Your Eyecare, a web and mobile application aimed at helping users manage and prevent eye strain through guided exercises. The app features a symptom-based recommendation system powered by a machine learning model, which suggests personalized routines for either eye strain relief or vision strengthening. It also includes a geolocation feature that connects users with the nearest eye doctors in Metro Manila.

The project involved full-stack development, including frontend design, backend API integration, SQL database management, and machine learning model training. I focused on building a user-friendly interface, ensuring responsive design across platforms, and delivering a health-oriented digital tool that blends accessibility with personalized care.

WORK EXPERIENCE

2025

Project Leader

Collaborated on the BlockBot Project, a Korean EdTech tool, involving testing, user feedback analysis, and product documentation.

Alezandra Denise Reyes

2018 - 2024

Virtual Assistant / Sales Representative

Delivered quality customer service, managed digital communications, and supported virtual meetings using Zoom and Google Meet, while strengthening organizational, time management, and teamwork skills.

Certifications

- Cisco CyberOps Associate
- Cisco Modules Completed: Intro to Networks, Switching & Routing, Enterprise Networking

Let's build!

THANK YOU
